

Exciting developments in Berberis research

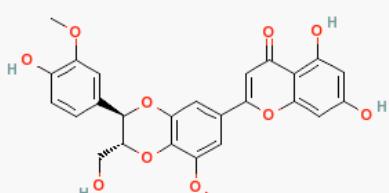

Berberine and synergy: overcoming multidrug resistance

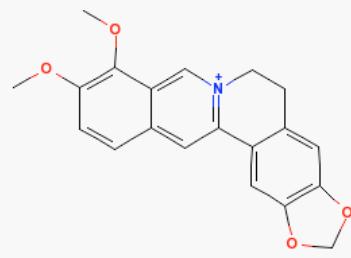

Berberis contains not only the alkaloid *berberine*, but also the flavolignan *5'-methoxyhydnocarpin*.

5'-methoxyhydnocarpin does not itself have antibiotic activity. But it can inhibit the multidrug resistant pumps (MDRs) in the microbial cell membrane, so that the antimicrobial alkaloid berberine stays inside the microbial cells.

Thus *5'-methoxyhydnocarpin* potentiates the antimicrobial effect of berberine, making Berberis a more potent antimicrobial than its isolated alkaloids¹.

5'-methoxyhydnocarpin (flavonolignan)

berberine (a protoberberine alkaloid with no phenol group)

Berberine enhances medical drugs

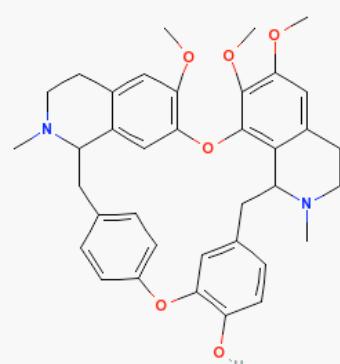

For example, berberine can enhance the effectiveness of the following medical drugs:

- *simvastatin*: berberine enhances reduction of lipid levels²
- *arsenic trioxide*: berberine enhances anticancer effect³
- *oxacillin*: berberine enhances action against MRSA⁴

Berberine reduces drug side effects

For example, berberine can reduce radiation-induced acute intestinal symptoms in abdominal radiotherapy⁵.

Berberis and treatment of cardiovascular disorders

berbamine (a benzylisoquinolene alkaloid with a phenol group)

Berberis contains the alkaloids berberine and *berbamine*, two

reported to have cardiovascular actions such as⁶:

- cardioprotective
- cardiotonic
- antiarrhythmic
- anticholesterolemic
- antiangiogenic
- anti-inflammatory (arterial endothelium)
- antiatherosclerotic
- vasodilatory
- hypotensive
- antithrombotic

BERBERIS JRHC EXAMPLE

Berberis: *Candida* infection

Jeremy has designed this new herb combination according to advances in research and according to the principles of Chinese medicine.

Herb	Ratio
Berberis vulgaris cortex	1
Echinacea angustifolia radix	1
Thymus vulgaris herba	1
Cinnamomum cassia cortex	1
Glycyrrhiza glabra radix	1

[Click on top menu bar](#) to see details of this Berberis combination.
